Product AI Assignment

Build a Working Prototype for Medical German Practice

A little context about A1 and A2

A1 and A2 are beginner levels of German, based on the Common European Framework of Reference for Languages (CEFR).

- **A1** = very basic German. The learner can understand and use simple words, phrases and sentences for everyday situations.
- **A2** = elementary German. The learner can understand and communicate using more vocabulary and slightly more complex sentences in familiar situations.

For this assignment, assume the learner is an **Indian nurse who is learning German at A1 or A2 level and preparing to eventually work in Germany**.

The medical vocabulary should therefore be appropriate for a beginner/elementary German learner. The learner should not be expected to understand complicated medical German.

Example

At A1 level, you might teach:

> **der Kopf** — head
> **der Schmerz** — pain
> **das Fieber** — fever

And then gradually use these words in simple sentences:

> **Mein Kopf tut weh.**
> My head hurts.

At A2 level, the learner could start handling slightly more contextual language:

> **Der Patient hat starke Kopfschmerzen.**
> The patient has a severe headache.

You do not need prior knowledge of A1/A2 German to complete this assignment. We are primarily evaluating your product thinking, learning design and ability to build a working solution. You may research the levels and the type of German vocabulary appropriate for each level.

The Core Problem

How might we help an Indian nurse at A1–A2 German level learn, remember and repeatedly practise medical German vocabulary in a simple, engaging way?

The experience should ideally allow a learner to:

Learn → Practise → Make mistakes → Get feedback → Revisit → Improve → Keep practising

The practice should not feel like the learner has “finished” after completing one quiz.

Your Assignment

Create a **working end-to-end prototype** for Medical German Practice for Nurses.

You are expected to take ownership of the complete product:

Understand the user → Define the learning experience → Design the product → Build the prototype → Test it → Improve it

You may research anything you need to understand the problem, including A1/A2 German, nursing vocabulary and how language-learning products work.
